# FILE COMMANDS
###############################################################################

ls                          # lists your files in current directory, ls <dir> to print files in a
specific directory
ls -l                       # lists your files in 'long format', which contains the exact size of
the file, who owns the file and who has the right to look at it, and when it was last modified
ls -a                       # lists all files in 'long format', including hidden files (name
beginning with '.')
ln -s <filename> <link>     # creates symbolic link to file
touch <filename>            # creates or updates (edit) your file
cat <filename>              # prints file raw content (will not be interpreted)
any_command > <filename>    # '>' is used to perform redirections, it will set any_command's stdout
to file instead of "real stdout" (generally /dev/stdout)
more <filename>             # shows the first part of a file (move with space and type q to quit)
head <filename>             # outputs the first lines of file (default: 10 lines)
tail <filename>             # outputs the last lines of file (useful with -f option) (default: 10
lines)
vim <filename>              # opens a file in VIM (VI iMproved) text editor, will create it if it
doesn't exist
mv <filename1> <dest>       # moves a file to destination, behavior will change based on 'dest'
type (dir: file is placed into dir; file: file will replace dest (tip: useful for renaming))
cp <filename1> <dest>       # copies a file
rm <filename>               # removes a file
find . -name <name> <type>  # searches for a file or a directory in the current directory and all
its sub-directories by its name
diff <filename1> <filename2>  # compares files, and shows where they differ
wc <filename>               # tells you how many lines, words and characters there are in a file.
Use -lwc (lines, word, character) to ouput only 1 of those informations
sort <filename>             # sorts the contents of a text file line by line in alphabetical order,
use -n for numeric sort and -r for reversing order.
sort -t -k <filename>       # sorts the contents on specific sort key field starting from 1, using
the field separator t.
chmod -options <filename>   # lets you change the read, write, and execute permissions on your
files (more infos: SUID, GUID)
gzip <filename>             # compresses files using gzip algorithm
gunzip <filename>           # uncompresses files compressed by gzip
gzcat <filename>            # lets you look at gzipped file without actually having to gunzip it
lpr <filename>              # prints the file
lpq                         # checks out the printer queue
lprm <jobnumber>            # removes something from the printer queue
genscript                   # converts plain text files into postscript for printing and gives you
some options for formatting
dvips <filename>            # prints .dvi files (i.e. files produced by LaTeX)
grep <pattern> <filenames>  # looks for the string in the files
grep -r <pattern> <dir>     # search recursively for pattern in directory

################################################################################
# COMMAND-LINE PROCESSING CYCLE
################################################################################

# The default order for command lookup is functions, followed by built-ins, with scripts and
executables last.
# There are three built-ins that you can use to override this order: `command`, `builtin` and
`enable`.

command  # removes alias and function lookup. Only built-ins and commands found in the search path
are executed
builtin  # looks up only built-in commands, ignoring functions and commands found in PATH
enable   # enables and disables shell built-ins

eval     # takes arguments and run them through the command-line processing steps all over again

################################################################################
# INPUT/OUTPUT REDIRECTORS
################################################################################

cmd1|cmd2  # pipe; takes standard output of cmd1 as standard input to cmd2

################################################################################
# PROCESS HANDLING
################################################################################

# To suspend a job, type CTRL+Z while it is running. You can also suspend a job with CTRL+Y.
# This is slightly different from CTRL+Z in that the process is only stopped when it attempts to read
input from terminal.
# Of course, to interrupt a job, type CTRL+C.

myCommand &  # runs job in the background and prompts back the shell

jobs         # lists all jobs (use with -l to see associated PID)

fg           # brings a background job into the foreground
fg %+        # brings most recently invoked background job
fg %-        # brings second most recently invoked background job
fg %N        # brings job number N
fg %string   # brings job whose command begins with string
fg %?string  # brings job whose command contains string

kill -l               # returns a list of all signals on the system, by name and number
kill PID              # terminates process with specified PID
kill -s SIGKILL 4500  # sends a signal to force or terminate the process
kill -15 913          # Ending PID 913 process with signal 15 (TERM)
kill %1               # Where %1 is the number of job as read from 'jobs' command.

ps           # prints a line of information about the current running login shell and any processes
running under it
ps -a        # selects all processes with a tty except session leaders

trap cmd sig1 sig2  # executes a command when a signal is received by the script
trap "" sig1 sig2   # ignores that signals
trap - sig1 sig2    # resets the action taken when the signal is received to the default

disown <PID|JID>    # removes the process from the list of jobs

wait                # waits until all background jobs have finished
